5/6 Pin Power Button/LED Adapter (For Dell Desktop Motherboards)

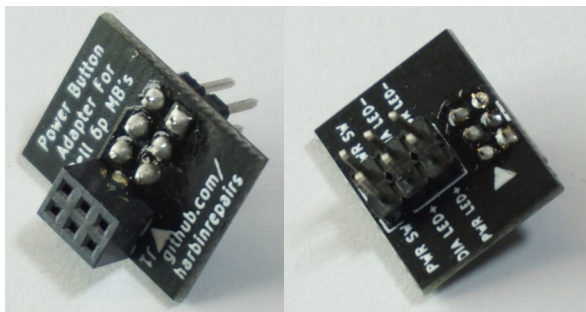

Revision 1.0

- Package Contents -

1 – Power/Diagnostic LED/Button Header

- Usage -

This adapter is designed to work with most Dell desktop motherboards that have a 5/6 pin header used to connect the power button, power LED, and diagnostic LED. This adapter allows you to use connect the front panel power button and power LED on a modern PC case to the proprietary connector used on most Dell desktops. These are commonly used to build budget gaming PC's using decommissioned office desktops and convert them to work with modern PC cases. Make sure to connect the LED connectors to the adapter matching the correct polarity. The images to the right show where these adapters need to be connected and the orientation. **Warning, connecting these adapters in the wrong orientation could result in damage to your motherboard.** More information and installation video can be found linked in our Github repository here: github.com/HarbinRepairs/Dell-Optiplex-MB-Header-Adapters

Harbin Repairs is not affiliated with Dell in any way shape or form.
